

Botnets

A **botnet** is a network of computers infected by malicious software controlled as a group.

Parties use them to perform coordinated mass attacks to overwhelm systems.

Some words composing the security question you need to answer to find the admin device are hidden on the devices composing the botnet. By arranging the cut out devices in specific orders, you can find five words and their positions in the question.

1. Organize the devices alphabetically by their **processor**.
2. Record and number each underlined word from 1 to 10 based on its current position.
3. Reorganize the devices in order from the device with the smallest first whole number in its **IP Address** to largest. (Example: 33 in **33**.219.199.24)
4. Record and number from 1 to 10 each IP Address's third number (Example: 159 in 251.49.**159**.158.)
5. Each **even** recorded word goes at each **even** recorded number's position in the security question.
